EQUATION HI LO

방정식 높음 낮음

Instructions

+ − x ÷ √

Getting Started

What you need:

- 1 x Equation Hi Lo Deck containing 52 cards:
    - 0 to 10 in each of the four suits *(Gold, Silver, Bronze, Black)*
    - 4 x Multiplication [x] Cards
    - 4 x Square Root [√] Cards
- 3 x starting cards per player:
    - 1 x Addition [+] Card per player
    - 1 x Subtraction [-] Card per player
    - 1 x Division [÷] Card per player
- 1 x *"1"* token per player
- 1 x *"20"* token per player
- Poker Chips

Setting up the game:

- Deal each player, *face-up* a **+**, **-** and **÷** card. Each player keeps these cards for the duration of the game
- Deal each player a *"1"* And *"20"* token.
- Distribute the poker chips evenly amongst all players.

Playing a Game

Quick Reference Guide

A full round consists of the following:

- **Forced Bet** – All players submit the minimum bet
- **Dealing Phase 1** – 3 Cards Each *(1 x face-up, 2 x face-down)*
- **Betting Phase 1** – Poker-style betting round.
- **Dealing Phase 2** – One additional *face-up* card each.
- **Calculation Phase** – 90 seconds to calculate an equation.
- **Betting Phase 2** – Poker-style betting round.
- **High/Low Bet** – Each player decides whether to bet high, low, or to perform a "swing" bet.
- **Results Phase** – Calculate the closest to each of the targets, and distribute winnings accordingly.

Forced Bet

- There exists a minimum “forced” bet that must be played by all players.
    - This can be 1 x poker chip each to start with.
    - As the game progresses, and to speed up the game, you can increase the minimum forced bet.

Dealing Phase 1

- Shuffle the main deck and deal each player a single “secret” card, *face-down*.
    - Each player can look at their own card.
    - If this is not a numbered card, then the card must be returned. The deck will be shuffled, and a new card dealt. This repeats until each player has a numbered “secret” card.
- Deal two further cards, *face-up*, to all players.
    - If a square root card [√] is drawn, then you will also be given an additional numbered card, *face-up*.
    - If a multiplication card [x] is drawn, the player must decide on whether to not to discard one their existing addition [+] or subtraction [-] cards, or they can decline the multiplication card [x].
        - Independent of which card is returned/declined, this player will receive an additional number card.
        - Note: The division card cannot be discarded.

    - If both the first and second card received are symbol cards, then the second must be returned and replaced with a number.
- Once all players have at least two *face-up* cards, the next phase begins.

Betting Phase 1

On a player's turn they can take one of three actions:

- **Raise:** On a player's turn, they may **Raise** the bet, adding to their chip count, forcing other players to match that bet (with a **Call**) should they wish to continue playing this round.

- **Call/Check**: This is the action of matching the existing bet in order to continue playing.
    - If another player has raised, then a player may **Call** that bet, playing the matching number of chips.
    - If there has been no raise, a player may **Check**, and pass the action to the next player in the round.

- **Fold**: If another player has raised the bet, and a plyer does not wish to match that bet, they can choose to **Fold**. Whereby they will not keep any chips already played and discard their existing hand.

This process is followed, much like Poker, until each player has bet the same number of chips or folded.

Dealing Phase 2

After the initial round of bets have been made, and each player has either matched the bet, or folded, then each player receives one additional *face-up* number card, following the same rules regarding multiplication/square root cards, as in Dealing Phase 1.

Calculation Phase

The core objective of Equation Hi-Lo is to then use *all* the cards in front of you, including your secret card, to make an equation where the result is as close to 1 (Low) or 20 (High) as possible.

It is important to note that calculations are permitted to result in a negative number. It is simply the closest to the 1 or 20 values, respectively, that wins.

During this phase, each player should establish an equation that equals to a number as close to 1 or 20.

Note that Square Root cards can only be used on a single number.

Players have 90 seconds for this phase - this should be timed. You can play shorter time limits too, but it is not recommended to go too much higher, as otherwise the game may take too long to play.

Betting Phase 2

With the calculations complete, it is now time for a last betting phase, following the same rules as Betting Phase 1.

High/Low Bet

In this phase, each player must decide if they are trying to make an equation that results in a value close to 1 (Low), 20 (High), or both (Swing). Once revealed, players are then split into two groups, depending on which target they are aiming for.

Each player must decide from one of three options:

- **Bet High (20) -** Players are making an equation that gets as close to 20 as possible.

- **Bet Low (1) -** Players are making an equation that gets as close to 1 as possible.

- **Swing Bet (1 and 20) -** Players must make two equations, one to get as close to 1, and another that gets as close to 20. In this case, the player must be the closest on *both*, if not, they lose both bets. If they are the closest on both, they will win both pots.

Each player places their chosen token(s) into a closed fist, and all players will reveal their choices at the same time.

Results Phase

Once all tokens have been revealed, each equation is formed using the cards in front of the players and shown to the table.

All players that played the “1” token are then compared against each other, and the closest result wins *half of the pot*.

All players that played the “20” token are then compared against each other, and the closest result wins the *other half of the pot*.

> *Note the pot is always split 50/50, not based on the split of players playing high or low bets.*

Remember, players that played a Swing Bet, must win both of their bets. If they lose one of them, the other is immediately lost too.

In the case of a tie, where two players end up with the same result, they are settled accordingly:

- **High (20) -** The player with the single *highest* card wins. In the case that this is also a tie, the player with the *highest* suited card wins, where the order of preference is therefore Gold > Silver > Bronze > Black.
- **Low (1) -** The player with the single *lowest* card wins. In the case that this is also a tie, the player with the *lowest* suited card wins, where the order of preference then becomes Black > Bronze > Silver > Gold.
